

## The Advantages of Working With the CME System:

- + Part of the CME System is an extensive database of standard markers.
- + These markers represent digitalized information about various processes and states:

1. Organs, tissue, and diseases of: gastrointestinal, cardiovascular, female genitourinary system, male urogenital system, nervous system, bones and joints, broncho-pulmonary system, upper respiratory tract, dental system, mammary glands, mesenchyme, endocrine system, immune system, etc.
  2. Environmental markers: minerals, foods, drinks, allergens, and toxins.
  3. Etiological markers such as: viruses, bacteria, fungi, parasites, toxins.
  4. Markers of medical and supplemental remedies: allopathic, homeopathic, Heel products, herbs, vitamins, microelements, aromatherapy oils, and dietary supplements.
- + Analysys are conducted by comparing a newly recorded marker with all standard markers from the CME database.

*“Correct is to recognize what diseases are and whence they come; which are long and which are short; which are mortal and which are not; which are in the process of changing; which are increasing and which are diminishing; which are major and which are minor; to treat the diseases that can be treated, but to recognize the ones that cannot be, and to know why they cannot be; by treating patients with the former, to give them benefit of treating them as far as it is possible.”*

# CME SWISS AG

## Innovative Medical Technologies

After many years of successful application throughout Europe and Asia, this cutting-edge, state-of-the-art analytical biofeedback system is now available to healthcare professionals in the USA.

## What CME Swiss AG makes

CME Swiss AG is a company based in Switzerland. The company develops new scientific devices and systems for medical and veterinary use. These systems allow for a holistic approach to many health issues. Use of such tools could make a person or pet reach a state of optimal health and improve their quality of life. Our technology was designed to help in providing a fuller picture of the current state of a patient's health and well-being. The CME System provides an opportunity to reduce the influence of existing pathological processes. The system could also assist the medical professional to decide which individual treatments or preventive measures are best suited for a particular patient.

### CME System Process

## CME Corrective Adjustment

To understand CME Corrective Adjustment, one must visualize the marker as the signal recorded in time and converted into a digital spectral diagram. This signal (marker) is combined with certain signals (standard markers) from the CME database, inverted, and sent back to the original source of the marker. Logically, if the primary signal is a plus (+) and the inverted feedback signal minus (-), when this inverted signal is sent back, the background electrical field is corrected and will adjust accordingly. These changes will in turn reflect on real processes, for example, corrected adjustment of a certain disease and reduction of its influence on the body.

### The CME System Technology

- + **Comfort** - Many diagnostic procedures are invasive and cause extreme discomfort for the patient. When using the CME System scanning and compensation, there is no discomfort.
- + **Monitoring** - Ability to monitor the dynamic changes in the state of health of the patient during follow-up visits. Ability to monitor the effectiveness of the prescribed treatment.
- + **Speed** - Full scan of all organ systems and states takes up to 60 seconds. Interpretation of the results, selection of individually effective remedies and treatments, could take from 15 to 60 minutes.
- + **Comprehensiveness** - Information data for all organs, systems, processes and other pathogens is collected simultaneously and cross-referenced.

## The CME System Technology

- + **Analysis** - Our technology allows for evaluation of the causality connection between the symptoms, pathologies and pathogenic factors. This property allows for a true analysis of the patient's condition and, as a result, to treat the real cause of a disease, rather than the symptoms.
- + **Safety** - No harmful influence on the patient during scanning, unlike fluorography or MRI diagnostics. The scanning is conducted in passive signal-receiving mode only.
- + **Targeting** - Corrective adjustment allows for influencing the elimination of the causes of the development of pathological processes without negatively affecting the vital physiological processes.
